

## Terminal Casino & Slot Machine

**Project description:** A console-based financial and gaming simulation that manages a virtual economy where players buy tokens, gamble on a slot machine, handle debt, and track sessions.

**1) Buy Tokens Kiosk:** Allows the user to convert their starting cash balance into playable tokens by calculating the exchange rate using division.

**2) Manual Spin:** The core game loop where the user bets tokens, generates three pseudo-random symbols, and calculates a multiplied payout if the symbols match.

**3) Auto-Spin (5x Mode):** Automatically place bets and spin the slot machine exactly five times in a row, safely halting early if the user's tokens run out mid-spin.

**4) The Loan Shark (Debt System):** Permits bankrupt players to borrow tokens to keep playing, creating a tracked debt variable that automatically intercepts and deducts from future slot machine winnings.

**5) Statistics Dashboard:** A tracked background system that allows the user to open a clean menu to view their total games played, accumulated wins, total losses, and current debt on demand.

**6) Cash Out & Exit:** Converts all remaining tokens back into cash, forcibly settles any outstanding loan debt from the user's balance, and prints a final mathematical receipt before terminating the program.
